## COMPLETE SPECIFICATION

## Dihydroorotic and Salts

We, ED. GEISTLICH SCHNE A.G., a Swiss Body Corporate, of Wolhusen, Lucerne, Switzerland, do hereby declare the invention for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the following statement:

This invention relates to novel chemical

compounds of use in geriatry.

Orotic acid, uracil-4-carboxylic acid, was isolated from milk for the first time in 1904 and has been found to be of importance in purine metabolism. In fact in both the young and the aging organism orotic acid plays a central role in protein and purine metabolism and is thus employed in geriatry both as the free acid and also as salts such as magnesium

It exerts a liver-protecting activity by formation of nucleic acids in the liver cells which may be detected by normal protein synthesis. Oretic acid also possesses a useful cholesterol-lowering activity, reducing the deposition of lipoids in the coronary artery. the aorta and other blood vessels. It has also been found that dihydroorotic acid possesses similar properties.

We have now found that aliphatic ammes we have now round that ampliance animals carrying a hydrophilic group such as a hydroxyl or amide group form salts with dihydrocrotic acid which possess several advantages over the free acid or its metal

These salts are surprisingly stable and without difficulty form 10-20% aqueous solutions whereas free dibydroorotic acid is substantially insoluble in cold water and the metal salts only sparingly soluble. Aqueous solution of the salts of the present invention. of up to 50% have, in fact, been prepared.

Further, the new salts show very low toxicity and a good physiological compati-bility, particularly compatibility in the stomach. In our investigations, they have

shown a relatively constant blood-level and an improved diffusion ratio and improved the capillary blood flow and generally promoted an easier flow of blood through the vascular system. The new saits have also been found to produce improvements in depth of sleep, in the level of depression and exhaustion and general condition and alert-

According to the present invention therefore we provided salts of dihydroorotic acid with primary, secondary or tertiary aliphatic amines, said amines having in the molecule at least one other hydrophilic group as defined

The term 'aliphatic amine' as used herein refers to amines in which an aliphatic group is directly bonded to a substituted or unsubstituted amino group: the aliphatic grouping may carry, besides the specified hydrophilic groups, other groups such as aryl

Suitable hydrophilic groups according to the present invention comprise hydroxy: esterified hydroxy e.g. p-amino-benzoxy; carboxy; amino and carbamoyl groups. Where two or more hydrophilic groups are present in the molecule they may be the same

Preferred ammes for salt-formation according to the present invention are aminoethanoi and mono- and dialkylaminoethanols, particularly methylaminoethanol ethylaminoethanol, dimethylaminoethanol and methylethylaminoethanol.

Other useful amines include \(\beta\)-diethy-laminobutyranilide and procaine.

Particularly preferred salts according to the present invention are the aminoethanol salts of dibydroorotic acid, especially dimethylaminothanol dihydroorotate. These in particular show very low toxicity, the LDso

of dimethylaminoethanol dihydroorotate in rats and mice being over 5000 mg/kg.

3004215585

According to a further feature of the present invention we provide a process for the preparation of the new saits according the invention comprising reacting dihydroorotic acid or a salt thereof with a primary, secondary or tertiary aliphatic amine carrying at least one further hy-drophilic group as defined above or a salt thereof whereby the amine dihydroorotate is

Preferably the acid and amine are heated together with or without 21 added scivent. The molar ratio may conveniently be 1: 1 or an excess of the amine may be used. The added solvent may, for example, be water or an organic solvent such as an alkanol e.g. methanol, ethanol or isoprepanol; an ester e.g. cthyl acetate or arryl acetate; a cyclic ether e.g. dicxan or tetrahydrofuran. or a substituted amide e.g. dimethylformamide or dimethylacetamide. The crystalline salt may then be isolated, for example, by concentration of the reaction mixture, e.g. under

According to a further feature of the present invention, we provide pharmaccutical compositions comprising as active in-gredient, at least one of the compounds according to the invention in association with a pharmaceutical carrier or excipient. The compositions may be presented in a form suitable for oral, rectal, topical or parental administration. Thus, for example, compositions for oral administration may be solid or liquid and may take the form of granules, tablets, coated tablets, effervescent tablets, capsules, syrups, emulsions, suspensions or 40 drops, such compositions comprising carriers or excipients conventionally used in the pharmaccutical art. hus, for example, suitable tabletting excipients include lactose. potato and soluble starches and magnesium stearate.

For parenteral administration, the carrier may be a sterile, parenterally acceptable liquid such as sterile water. parenterally acceptable oil, e.g. arachis oil contained in ampoules. Compositions for rectal administration may take the form of suppositories, the carrier comprising a

Compositions for topical application may. for example, take the form of creams.

Advantageously, the compositions may be formulated as dosage units, each unit being adapted to supply a fixed dose of active ingredient. Tablets, coated, tablets, effervescent tablets, capsules, suppositories and

ampoules are examples of suitable dosage unit forms. Each dosage unit preferably contains 10.0 to 200.0 mg. and advantage ously 20.0 to 50.0 mg of active ingredient

The compositions according to the present invention may further contain other useful physiologically active ingredients for example, vitamins, minerals, amino acids or

Vitamins can be acided readily to creams. especially creams consisting of water-oil emulsions. Vitamins ADE and K. are soluble in the oil phase while vitamins B1, B2. B<sub>6</sub>, B<sub>12</sub> and C are soluble in the aqueous phase. The dialkylaminoethanol dihydroorotates can well be added to the cream in

The dihydroorotate salts are absorbed from the skin and cause increased circulation of the blood. This effect is increased by addition of vitamins and enzymes or enzyme systems such as phospharases, which influence the cell respiration favourably. Parlicularly useful materials containing enzymes are placentz-extracts from cows, sheep and pigs and also human placenta extracts. These should be extracted at the lowest temperature possible (not about 40°C). At this temperature, the natural enzyme system will not be destroyed. Such

creams symptoms of age appearing on the surface area of the body. The skin becomes smoother, shrinking of the skin due to water Successfully losses is checked and the metabolic products in the form of pigments on the skin are at least partly eliminated. Also, deep-seated spasms and muscle pains of the rheumatic type are favourably influenced by creams of this type.

The preferred concentration of the active dihydroorotate in such topical formulations is 0.01 to 1% by weight preferably about

The following examples illustrate the preparation of compounds according to the invention, and also pharmaceutical compositions containing such compounds as active

Example 1

2-Diethylaminoethanol-dihydroorotate

0.79 g of dihydroorotic acid were suspended in 30 ml of ethanol and 0.67 ml of diethylaminoethanol were added. The mixture was heated at 70°C until the dihydroorotic acid formed a clear solution. The reaction mixture was filtered hot and evaporated to dryness in vacuo at 30-40°C.

Yield: 1.4 g of dihydroorotate; readily soluble in water. Found: C. 48.01 H. 8.00 N. 15.52% C. 47.99 H. 7.69 N. 15.27%
